A.1 Overview about the OBIS-Code List

OBIS codes in Smart Metering and other systems are applied as identifiers for metering data and associated information

Each combination of device type and MB-Tag (refer to OMS-Specification Vol.2 - Annex B) is associated with one OBIS-Code in this OBIS-Code List. But one OBIS-Code may be associated with one or several MB-Tags. There are some OBIS-Codes of COSEM objects for the device type "Generic", for which the information mapped is either derived from message header (like the OMS end-device address) or which are generated by the gateway itself (like receiving time of the message). Such OBIS-Codes are not associated to a dedicated MB-Tag.

Example of assignment:

6-0:1.2.0*255 declares total consumption of imported heat energy (in Watt or Joule) at due date. This OBIS-Code is applied by the gateway if either MB-Tag EW1!D or EJ1!D is received from a meter with one of the M-Bus device types 04h, 0Ch or 0Dh.

A.2 Legend and Notes

M = Mandatory (These data objects shall be provided.)

Ax = Alternatively (At least one of the with 'A' and identical number marked data objects is mandatory.)

O = Optional (These data objects may or may not be provided.)

Note that the B-Field of the OBIS Code shall be built from the subunit in related DIFE of data point (refer to [EN13757-3:2018], 6.3.9). If the OMS end-device uses one channel only then the subunit and also the B-Field of the OBIS -Code shall be 0 (as listed in this table). If a meter uses more than one channel then the subunit and also B-Field of OBIS-Code shall declare channel numbers which starts with 1.

Sets of historical billing values, indicated by "f" in value group F of an OBIS-Code, are always coded with a final DIFE with the value 00h. The number of DIFEs is variable. For downward compatibility reasons and for realization of constant data record length it is allowed to use more DIFEs (between the DIF and the final DIFE = 00h) than necessary.

For historical values, indicated by "f" in value group F of an OBIS-Code, the "f" shall be replaced by the content of Storage number X (refer to OMS-S2 Annex B)!

For tariff values indicated by "e" in value group E of an OBIS-Code, the "e" shall be replaced by the content of Tariff number T (with T=1...15; refer to OMS-S2 Annex B)!

Table footnotes

¹ Note that the time stamp "Time, date of reading" (A-0:0.1.2*255 for A=1 or 7 and A-0:0.9.3*255 for A=4, 5, 6, 8 or 9) is calculated by the gateway itself based on the time stamp "Date of OMS end-device" (A-0:0.9.2*255) and "Time of OMS end-device" (A-0:0.9.1*255) and the Run time difference (transmitted with DP1!).

² Note that for electricity meters supporting power maximum registers (1-0:1.6.0*255 / 1-0:1.6.0*f and 1-0:2.6.0*255 / 1-0:2.6.0*f), the objects containing the actual maximum value and the associated point of time of the actual maximum value must always be transmitted. The transmission of both M-Bus data points shall be within the same M-Bus message.

³ Note that the MB-Tag DT1! consists of both date and time information and therefore have to be split into two different OBIS codes "Time of OMS end-device" (A-0:0.9.1*255) and "Date of OMS end-device" (A-0:0.9.2*255) according the rules of the data type.

⁴ This note is intentionally blank.

⁵ The Application Layer Address (ALA) is transported either in the TPL or in the DLL (if no TPL address field exists (short header)). The byte order for the OBIS-Code payload shall be according [EN13757-7:2018] Table 12. Note that the order of the address elements in the DLL is different (refer to [EN13757-7:2018], Table 43) and has to be adapted!

⁶ The Link Layer Address (LLA) is always transported in the DLL.

Case wM-Bus: If no TPL address field is used (short header) then the LLA is identical with the ALA. The Byte order of the received LLA for wireless M-Bus is according to [EN13757-7:2018], Table 43. The byte order for the OBIS-Code payload shall be adapted according [EN13757-7:2018], Table 12.

Case M-Bus: The DLL contains a single Byte address (primary address) only. This byte shall be provided in the OBIS-Payload.

⁷ In case of a combined heat/cooling meter (device type 0Dh), the heating application is the leading function. Variables such as:

- Time, date of reading
- Time integral
- Time of OMS end-device
- Date of OMS end-device
- Temperature

are global variables which are valid for both (heat and cooling) but only linked to the heat part of the meter.

⁸ The referable M-Bus device types for each OBIS Value Group are shown in the headline (bold) of the column "Description"

⁹ If the data point DP2! (7-0:0.8.28*255) is present the OBIS-Code 7-0:43.63.0*255 (no default averaging value) applies. Otherwise the OBIS-Code 7-0:43.15.0*255 (averaging period 1) applies.

¹⁰ If the data point DP2! (7-0:0.8.28*255) is present the OBIS-Code 7-0:43.64.0*255 (no default averaging value) applies. Otherwise the OBIS-Code 7-0:43.16.0*255 (averaging period 1) applies.

¹¹ If the data point DP2! (7-0:0.8.28*255) is present the OBIS-Code 7-0:43.65.0*255 (no default averaging value) applies. Otherwise the OBIS-Code 7-0:43.17.0*255 (averaging period 1) applies.

¹² Mapping of OBIS-Value to M-Bus Value:

OBIS-Value | state change : M-Bus-Value

a=transition | 0->1 : 01h

b=transition | 1->0 : 00h

c=transition | 2->0 : 00h

d=transition | 0->2 : 02h

e=transition | 2->1 : 01h

f=transition | 1->2 : 02h

g=transition | 1->2 (same as f) : 02h

h=transition | 2->1 (same as e) : 01h

A.3 List of OBIS-Codes

A.3.1 OBIS Value Group A = 0: Generic

Type	M/O/A	OBIS-Code	Description ⁸	MB-Tag
Generic		0	All	
Current time	M	0-0:0.9.1*255	Local time (Receiving time of MUC. Data object generated automatically by MUC!)
